

Bug #2 - Loading state stuck After API failure

When the frontend repo tasks from the backend and request failed, the page could remain stuck on

- Loading tasks...

No proper feedback/error about the request failure provided getting to the user

*Where - useTasks.js (Frontend)
where the API request and loading/error states are handled.

*How I found it

- I tested what happens when the backend is not available. I stopped the spring Boot server and refreshed the Frontend.

It displayed "Loading - tasks..." instead of error of failure.

Then I checked useTasks.js and found that loading was not reset when the request failed being

*Root Cause

- Before making request, loading was set to true.

- When request succeeded, the code changed it back to false.
- But when failed, loading remain true

Fix :- Updated the error handling so that loading is also set to false when request fails.

```
.catch (err) => {  
    setError(err.message);  
    setLoading (false);  
});
```

I also clear the previous err. before starting a new request.

```
setError (null);  
setLoading (true);
```

Result :- When API succeeds - tasks are displayed and loading stops

- When API fails - loading stops and the error is stored / displayed.
