Bug #4: - Invalid page/page size causing backend error

*Where :- TaskController.java (Backend)

*How I found it

- Thinking what if someone tried to fetch a page size that does not exist, like
 - negatives or a big size.
- So I tested the /api/tasks manually by changing the page and page size query parameter.

eg page = 0

$$\begin{aligned}\therefore \text{int start} &= (\text{page} - 1) * \text{pagesize}; \\ &= (0 - 1) * 10 \\ \text{start} &= -10\end{aligned}$$

This gives server error

* Root cause

- The API accepts page and page size directly from the request
- the code assumes that the client would always send valid positive values.

* Fin :- I added validation before calculating start and end

if (page < 1) page = 1;

if (pagesize < 1 || pagesize > 100) {
 pagesize = 10;

This makes pages at least 1, the starting idn cannot become negative

* Result :-
 page = 0 → uses page 1
 page = -1 → uses page 1
 pagesize = 200 → uses safe default pagesize 10
